

SynDaver Airway Trainers are realistic medical training platforms ideal for teaching the techniques associated with tracheal intubation.

With these trainers, students will be able to learn and master surgical techniques on biohazard-free material that looks, feels, and behaves like live human tissue.

These models include realistic oral cavity with a hard and soft palate, tongue, uvula, epiglottis and vocal cords. The soft neck with cricocartilage allows users to perform Sellick's maneuver to give a better view of the larynx and/or reduce gastric reflux.

Complete Functionality Out of the Box

Components include:

- Torso with age-accurate anatomy
- Storage Case
- Care Kit

Relevant Skills

- Intubation
- Airway management exercises

Tissue Features

SynTissue synthetic human tissues are made from water, fibers and salts, boasting the world's most lifelike and realistic tactility. SynTissue synthetic tissues match the physical and mechanical properties of live tissue.
